ZERO TO HERO

PROJECTION EDITION
DRONE
Practical UAV operator crash course / 2026
10 modules / 60 teaching slides / 40 hours

Every launch is a decision

A safe flight begins before motors start.
1 Define the mission and its expected benefit.
2 Check authority, aircraft, crew and site.
3 Separate essential risk from optional convenience.
INSTRUCTOR DEMO WATCH FOR
Ask: What could force a NO-GO right now? A drone app saying Ready does not mean legal or saf
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 01 / 60

What CAAP expects

Do not guess regulatory permission.
1 Classify the operation: commercial or non-commercial.
2 Check CAAP rules, local restrictions and required certificates/permits.
3 Verify approvals for special operations before arriving.
INSTRUCTOR DEMO WATCH FOR
Demonstrate finding CAAP Types of Operations and RPAS Regulations Recheck requirements fo
mission.
pages.
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 02 / 60

Airspace and other aircraft

Manned aircraft always take priority.
1 Identify airports, helipads, approach routes and temporary restrictions.
2 Watch for low-flying emergency, military or agricultural aircraft.
3 Yield, descend or land safely when conflict develops.
INSTRUCTOR DEMO WATCH FOR
Mark hazards on a printed field map. Map apps can lag changes in airspace restrictions.
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 03 / 60

Weather is a flight control

Wind and visibility change the risk envelope.
1 Check surface wind, gusts, rain risk and visibility.
2 Consider sun glare, terrain turbulence and changing conditions.
3 Apply aircraft-specific operating limits with margin.
INSTRUCTOR DEMO WATCH FOR
Use a GO / NO-GO board for two weather scenarios. Never teach flying into unsafe winds for con
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 04 / 60

Build your safe flight box

People, obstacles and separation matter.
1 Define takeoff/landing area, flight limits and spectator zone.
2 Assign pilot-in-command and observer duties.
3 Choose emergency landing options and abort triggers.
INSTRUCTOR DEMO WATCH FOR
Walk site perimeter and identify sterile zones. Avoid flight over uninvolved people.
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 05 / 60

The one-minute brief

Communication prevents avoidable incidents.
1 Mission and time limit; flight area and altitude plan.
2 Who calls traffic, batteries, hazards and emergency landing.
3 Clear verbal commands: HOLD, ABORT, LAND, CLEAR.
INSTRUCTOR DEMO WATCH FOR
Role-play the briefing with pilot and spotter. Everyone should know who can call STOP.
DRONE SURVIVAL RULES / SAFETY - SKILL - MISSION 06 / 60

The flight system

Know what each part is responsible for.
1 Airframe, motors, props and power deliver thrust.
2 Flight controller and IMU stabilize attitude.
3 GNSS, compass, vision sensors and radios support navigation.
INSTRUCTOR DEMO WATCH FOR
Point to each component on the actual aircraft. A GNSS receiver does not guarantee perfect posit
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 07 / 60

Power is an operating limit

Batteries require discipline, not guesswork.
1 Inspect housing, swelling, contacts and temperature.
2 Use the correct charger and manufacturer procedures.
3 Plan landing reserve from conditions and mission length.
INSTRUCTOR DEMO WATCH FOR
Show examples of safe/unsafe battery findings. Do not use damaged or swollen packs.
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 08 / 60

Inspect before arming

A repeatable checklist beats memory.
1 Check propellers, mounts, arms and payload security.
2 Confirm controller link, firmware compatibility and warnings.
3 Verify takeoff site and nearby people are clear.
INSTRUCTOR DEMO WATCH FOR
Instructor demonstrates a deliberate missing-propeller defect. Never spin unguarded propellers or
workbench.
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 09 / 60

The home point trap

Return-to-Home only helps when configured well.
1 Verify recorded home point and position quality.
2 Set safe return altitude for obstacles and terrain.
3 Know what happens on low battery, lost link and manual cancel.
INSTRUCTOR DEMO WATCH FOR
Compare poor and good RTH plans on a site sketch. RTH is not collision-proof or universally avai
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 10 / 60

Know the flight mode

Automation changes pilot workload.
1 Distinguish position-hold, altitude-hold and manual-assist behavior.
2 Know which modes depend on GNSS/vision sensors.
3 Practice identifying current mode, battery and signal.
INSTRUCTOR DEMO WATCH FOR
Use the controller screen to read three status fields. Switching modes without understanding beha
increases risk.
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 11 / 60

Ready means cross-checked

The pilot accepts the final decision.
1 Read manufacturer warnings and respond to each.
2 Confirm observer, crew brief, battery, area and mode.
3 Use a spoken READY / CLEAR / TAKEOFF call.
INSTRUCTOR DEMO WATCH FOR
Run the complete checklist with a second trainee watching. Do not dismiss unexplained calibration errors.
KNOW YOUR MACHINE / SAFETY - SKILL - MISSION 12 / 60

The four control axes

Understand movement before moving sticks.
1 Throttle changes lift/height depending on flight mode.
2 Yaw rotates heading; pitch moves fore/aft; roll moves sideways.
3 Practice with the exact transmitter mode used in training.
INSTRUCTOR DEMO WATCH FOR
Map stick inputs on a simulator with props removed from live aircraft. Do not assume stick layouts identical across equipment.
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 13 / 60

Eyes outside, data inside

Scan the aircraft and reference points.
1 Keep visual orientation and separation.
2 Use telemetry for battery, mode, altitude and warnings.
3 Take short, deliberate looks at the screen.
INSTRUCTOR DEMO WATCH FOR
Alternate 5-second external scan and status confirmation. Do not fly by the screen alone for VLOS
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 14 / 60

Takeoff sequence

Small, confident and controlled.
1 Confirm CLEAR command and stable system status.
2 Lift steadily to a safe supervised training hover.
3 Hold position and assess drift, vibration and control response.
INSTRUCTOR DEMO WATCH FOR
Instructor shows one correct and one aborted simulated launch. Never take off when the area is n
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 15 / 60

Hover is a skill

Stability needs constant awareness.
1 Use small inputs; neutralize to stop drift when appropriate.
2 Keep orientation known and a safe horizontal margin.
3 Respond to wind within approved operating limits.
INSTRUCTOR DEMO WATCH FOR
Use a ground reference marker without flying directly over observers. Do not chase errors with lar
stick movements.
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 16 / 60

Translate, stop, repeat

Build dependable movement patterns.
1 Move forward and backward in a defined flight box.
2 Move left and right while maintaining heading.
3 Return to center and stop with smooth control.
INSTRUCTOR DEMO WATCH FOR
Trainees call intention before each movement. Maintain separation from other operating aircraft.
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 17 / 60

Land and secure

The sortie ends after post-flight checks.
1 Confirm landing site and approach path.
2 Descend steadily and verify touchdown/disarm.
3 Check battery, airframe and log anomalies.
INSTRUCTOR DEMO WATCH FOR
Practice positive verbal landing callouts. Never approach moving propellers.
FIRST FLIGHT: MASTER THE CONTROLS / SAFETY - SKILL - MISSION 18 / 60

Orientation changes everything

Aircraft-relative commands can feel reversed.
1 Nose-out feels intuitive; nose-in often reverses lateral perception.
2 Use tiny inputs and keep a visual reference.
3 Train nose-in in simulator before the live-aircraft gate.
INSTRUCTOR DEMO WATCH FOR
Show two identical roll inputs at opposite headings. Panic corrections are often larger than the orig
drift.
PRECISION FLIGHT / SAFETY - SKILL - MISSION 19 / 60

Build the square

Edges teach planning and discipline.
1 Select safe corner references in an open area.
2 Fly straight legs, pause and rotate deliberately.
3 Prioritize control over speed.
INSTRUCTOR DEMO WATCH FOR
Trace route on the field diagram before flight. Never use public roads or crowds as training corner
PRECISION FLIGHT / SAFETY - SKILL - MISSION 20 / 60

Figure-eight coordination

Turn while controlling speed and spacing.
1 Plan two loops and a central crossing reference.
2 Maintain visible clearance across the entire pattern.
3 Slow down before turns instead of correcting too late.
INSTRUCTOR DEMO WATCH FOR
Instructor demonstrates in simulation first. Do not force a figure-eight beyond safe visual range.
PRECISION FLIGHT / SAFETY - SKILL - MISSION 21 / 60

Nose-in confidence

Recover orientation without guessing.
1 Stop translation and stabilize before making a correction.
2 Use familiar reference points and known heading.
3 If confused, call HOLD and request assistance early.
INSTRUCTOR DEMO WATCH FOR
Practice 20-second nose-in hover in simulator. Disorientation is not a reason to accelerate.
PRECISION FLIGHT / SAFETY - SKILL - MISSION 22 / 60

Precision landing

Arrival geometry matters more than speed.
1 Choose a clear, repeatable approach path.
2 Reduce drift, align and descend with margins.
3 Judge accuracy only after safe touchdown.
INSTRUCTOR DEMO WATCH FOR
Compare hard fast arrivals with smooth controlled arrivals. Landing inside the target must never o
safety.
PRECISION FLIGHT / SAFETY - SKILL - MISSION 23 / 60

Flight discipline

Quality is repeatable, not dramatic.
1 State next movement before executing.
2 Monitor battery and time against the plan.
3 Stop and reset after any unstable maneuver.
INSTRUCTOR DEMO WATCH FOR
Coach provides verbal prompts rather than stick intervention when safe. Clean control comes befo
speed.
PRECISION FLIGHT / SAFETY - SKILL - MISSION 24 / 60

Emergency priorities

People first. Aircraft second. Mission last.
1 Prevent injury and preserve safe separation.
2 Identify the actual state: position, battery, link and mode.
3 Choose the safest available recovery option.
INSTRUCTOR DEMO WATCH FOR
Use a fast verbal scenario: mission vs people vs aircraft. Do not save the mission at the expense
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 25 / 60

Low battery

Landing reserve is not optional.
1 Identify first and critical warnings early.
2 Decide whether home, a safe nearby landing or immediate landing is appropriate.
3 Account for wind and transit energy.
INSTRUCTOR DEMO WATCH FOR
Rehearse a decision tree from battery trend data. An automated warning may arrive too late for pc
planning.
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 26 / 60

Link loss

Configured behavior determines the outcome.
1 Know exact aircraft and receiver loss-link settings.
2 Maintain observer watch and avoid panic commands.
3 Apply manufacturer-specific procedure if link returns.
INSTRUCTOR DEMO WATCH FOR
Simulate lost control link in approved software only. Never deliberately disconnect controls on a liv
sortie.
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 27 / 60

Position and sensor faults

Automation can degrade without notice.
1 Recognize GNSS or vision-system warnings.
2 Avoid mode changes that require invalid sensors.
3 Reduce workload and recover only within demonstrated pilot capability.
INSTRUCTOR DEMO WATCH FOR
Practice sensor degradation in simulator. RTH may not function with unreliable position.
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 28 / 60

The abort ladder

Know your exit before launch.
1 Cancel tasking, regain stable control, select safe route, land.
2 Call ABORT / HOLD / LAND with observer confirmation.
3 Record event after the aircraft is secure.
INSTRUCTOR DEMO WATCH FOR
Rehearse radio-style call-and-response. Do not improvise a new flight profile mid-emergency.
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 29 / 60

After the incident

Learning is part of safety.
1 Account for all people and any damage.
2 Secure aircraft and batteries before troubleshooting.
3 Document event and follow mandatory reporting rules if applicable.
INSTRUCTOR DEMO WATCH FOR
Complete a mock near-miss report in three sentences. Avoid restarting before fault cause is unde
WHEN THINGS GO WRONG / SAFETY - SKILL - MISSION 30 / 60

Collect evidence, not scenery

Every image should answer a question.
1 Define subject, required detail and final deliverable.
2 Plan viewpoint, time of day and glare risk.
3 Use overlap where continuity or mapping is needed.
INSTRUCTOR DEMO WATCH FOR
Compare a scenic frame against an inspection-ready frame. Attractive footage is not necessarily u
evidence.
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 31 / 60

Nadir and oblique

Two views support different tasks.
1 Nadir: ground area, roofs and map coverage.
2 Oblique: facades, damage evidence and feature context.
3 Capture orientation/scale references when practical.
INSTRUCTOR DEMO WATCH FOR
Match six sample features to best view type. Do not imply oblique stills are survey-grade maps.
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 32 / 60

Avoid image failure

Fix quality at capture time.
1 Prevent motion blur; hold stable before exposure.
2 Check focus, exposure and shadow detail.
3 Avoid aggressive digital zoom for evidence detail.
INSTRUCTOR DEMO WATCH FOR
Repeat a test scene with wrong then corrected exposure. Unrecoverable blur cannot be fixed relia
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 33 / 60

Gimbal and flight path

Keep capture consistent.
1 Choose safe height and route for subject coverage.
2 Use repeatable angle and heading for comparisons.
3 Maintain visual observer and terrain clearance.
INSTRUCTOR DEMO WATCH FOR
Sketch a four-shot capture plan. Camera attention must not replace aircraft observation.
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 34 / 60

Metadata and chain of custody

Good files remain traceable.
1 Record time, operator, site and mission purpose.
2 Preserve originals and separate edited copies.
3 Check geotags; do not assume they are always accurate.
INSTRUCTOR DEMO WATCH FOR
Rename files by mission, date, location and sequence. Do not share images containing private de
authorization.
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 35 / 60

Quality gate

Review before leaving the site.
1 Confirm complete coverage and no missing areas.
2 Inspect representative images for sharpness and exposure.
3 Back up the dataset and note limitations.
INSTRUCTOR DEMO WATCH FOR
Perform a five-image quality review with a partner. Missing evidence is harder to recover after demobilization.
CAMERA AND AERIAL DATA / SAFETY - SKILL - MISSION 36 / 60

Automation is supervised flight

The pilot remains responsible.
1 Route planning reduces stick workload but adds planning hazards.
2 Check obstacles, terrain, people, battery and permission.
3 Define safe pause, abort and return procedure.
INSTRUCTOR DEMO WATCH FOR
Show a route that looks good on screen but intersects a tower. Uploading a route is not the same verifying it.
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 37 / 60

Waypoint logic

Every point changes aircraft behavior.
1 Create takeoff, navigation and return/landing sequence.
2 Set flight mode, altitude frame, speed and expected action.
3 Check route continuity and safe starting position.
INSTRUCTOR DEMO WATCH FOR
Create a four-point route in QGroundControl. Planned Home may differ from aircraft actual Home.
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 38 / 60

Survey coverage

Image geometry determines map quality.
1 Draw area polygon and grid.
2 Specify front/side overlap appropriate to imagery and terrain.
3 Check camera triggering, mission time and terrain following.
INSTRUCTOR DEMO WATCH FOR
Use QGroundControl Survey pattern on a sample rectangle. Terrain elevation variation can invalid
assumptions.
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 39 / 60

Mission verify

The vehicle must match the plan.
1 Save versioned plan; upload to correct vehicle.
2 Read back/confirm mission if supported.
3 Review altitude, return action, geofence and battery margin.
INSTRUCTOR DEMO WATCH FOR
Have a partner perform a blind mission checklist. Do not launch an unverified or stale plan.
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 40 / 60

From photos to map

Photogrammetry needs quality input.
1 Inspect blur, geotags and coverage.
2 Process images to orthomosaic and optional surface/point cloud.
3 Use GCPs/RTK for accuracy requirements when appropriate.
INSTRUCTOR DEMO WATCH FOR
Review a sample WebODM output and missing-coverage artifact. A pretty map is not proof of surv
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 41 / 60

Deliver evidence with limitations

Quality includes honesty.
1 Export map with coordinate system and date.
2 Note coverage gaps, georeferencing method and accuracy limits.
3 Attach a concise mission log and QA checklist.
INSTRUCTOR DEMO WATCH FOR
Inspect map distortion around edges. Do not claim centimeter accuracy without validation.
AUTONOMOUS FLIGHT AND MAPPING / SAFETY - SKILL - MISSION 42 / 60

2026 capability map

Buy outcomes, not buzzwords.
1 AI vision can assist search, tracking and inspection review.
2 RTK improves positioning when corrections and setup are valid.
3 Thermal and LiDAR answer different sensing questions.
INSTRUCTOR DEMO WATCH FOR
Choose the right sensor for a roof, field and utility pole. AI confidence is not verified truth.
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 43 / 60

AI in the loop

Human verification remains essential.
1 Object detectors produce candidate detections, not proof.
2 Evaluate false positives, false negatives and image conditions.
3 Keep human authority over flight and safety decisions.
INSTRUCTOR DEMO WATCH FOR
Audit ten sample frames and mark missed detections. No automatic pursuit of people in training e
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 44 / 60

Navigation beyond basic GNSS

Redundancy brings complexity.
1 GNSS positioning may degrade near structures or canopy.
2 Visual/inertial aiding can help when fitted and validated.
3 RTK needs adequate correction, geometry and data workflow.
INSTRUCTOR DEMO WATCH FOR
Compare sample position traces: GNSS vs corrected survey. Do not promise reliable GNSS-denie
every drone.
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 45 / 60

Different sensors, different answers

Know what the dataset actually measures.
1 RGB captures appearance and texture.
2 Thermal measures radiance/temperature patterns with caveats.
3 LiDAR estimates 3D range and geometry.
INSTRUCTOR DEMO WATCH FOR
Match sample data to an inspection question. Thermal imagery is not an x-ray or definitive defect
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 46 / 60

Connected autonomous systems

Remote operations require greater assurance.
1 Drone docks and remote dispatch change oversight needs.
2 Multi-drone/relay links add coordination and failure modes.
3 BVLOS and remote operations may require special permissions.
INSTRUCTOR DEMO WATCH FOR
Map actors in a drone-in-a-box service workflow. Autonomy never cancels airspace, privacy or risk
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 47 / 60

Practical technology decision

Match capability to hazard, cost and evidence.
1 State mission need, sensor, software and validation method.
2 Show a low-cost fallback and failure case.
3 Separate proven workflows from experimental demonstrations.
INSTRUCTOR DEMO WATCH FOR
Teams pitch one upgrade in 60 seconds. Reject innovation that lacks an identifiable use case.
NEXT-GENERATION UAV TECHNOLOGY / SAFETY - SKILL - MISSION 48 / 60

Mission brief to purpose

Translate an ask into a deliverable.
1 Choose site survey, mock damage assessment, field observation or inspection.
2 Define beneficiary, outputs, coverage and acceptance test.
3 Set timeline, operating limits and risk constraints.
INSTRUCTOR DEMO WATCH FOR
Turn a vague request into a two-line mission statement. Do not fly before the information need is c
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 49 / 60

Crew roles

One mission, clear authority.
1 Assign pilot, observer, data lead and safety lead (as available).
2 Use closed-loop communications on hazards and commands.
3 Clarify abort authority and changes in control.
INSTRUCTOR DEMO WATCH FOR
Run a 90-second role brief. No overlapping or conflicting pilot control.
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 50 / 60

Mission card

Write the plan before the flight.
1 Site, mission, flight box, times and weather.
2 Aircraft, battery, planned route and contingencies.
3 Evidence list and privacy/data-handling plan.
INSTRUCTOR DEMO WATCH FOR
Fill one-page mission card and conduct peer challenge. Unreviewed changes require a new GO /
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 51 / 60

Fly and monitor

Observe the mission, not just the camera.
1 Announce takeoff, checkpoints, warnings and landing.
2 Monitor position, margins, battery, people and airspace.
3 Abort if a critical assumption fails.
INSTRUCTOR DEMO WATCH FOR
Instructor injects harmless verbal scenario change. Do not force completion when conditions chan
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 52 / 60

Verify the data

A mission is unfinished without usable output.
1 Check images/logs while still at site.
2 Identify gaps, re-fly only if safe and authorized.
3 Save originals and record data limitations.
INSTRUCTOR DEMO WATCH FOR
Use a short QA checklist before demobilizing. Do not invent observations from ambiguous imagery
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 53 / 60

Debrief like an operator

Close the loop.
1 Compare planned objectives with delivered outputs.
2 Record time, deviations, anomalies and lessons.
3 Issue an actionable one-page mission summary.
INSTRUCTOR DEMO WATCH FOR
Each crew member gives one improvement. A clean report includes what you do not know.
THE REAL-WORLD MISSION / SAFETY - SKILL - MISSION 54 / 60

The checkride standard

Reliability matters more than showmanship.
1 Know the mission, hazards, aircraft and pilot limits.
2 Prioritize repeatability, safe margins and communication.
3 Any unsafe condition means pause or abort.
INSTRUCTOR DEMO WATCH FOR
Review assessed competencies before trainee begins. The examiner never rewards unnecessary
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 55 / 60

Gate 1: safety

Verify a real GO / NO-GO decision.
1 Site and airspace review; weather and crew roles.
2 Preflight, battery, RTH and modes.
3 Correct reject/abort when a critical hazard exists.
INSTRUCTOR DEMO WATCH FOR
Use one hidden defect card. Critical misses override numeric scores.
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 56 / 60

Gate 2: control

Demonstrate essential flight skill.
1 Safe takeoff, hover and four-direction translation.
2 Controlled turn/precision element at trainee level.
3 Safe return and landing.
INSTRUCTOR DEMO WATCH FOR
Assessor observes without unnecessary prompting. Flight difficulty is adjusted for safe conditions.
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 57 / 60

Gate 3: judgment

Think while under controlled pressure.
1 Respond verbally to two emergency scenarios.
2 Choose a safe recovery or abort method.
3 State when RTH cannot be trusted.
INSTRUCTOR DEMO WATCH FOR
Use simulator or oral decision card after landing. Never introduce faults in actual flight.
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 58 / 60

Gate 4: autonomy and data

Show a usable mission workflow.
1 Inspect a waypoint plan and verify correct vehicle.
2 Identify one route hazard and one QA concern.
3 Deliver map/image example with limitations.
INSTRUCTOR DEMO WATCH FOR
Short desktop GCS verification plus output review. Tool familiarity does not imply unrestricted auto
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 59 / 60

Close the loop

Assessment is evidence of current skill.
1 Log the observed competency for each trainee.
2 Reassess failed gates after targeted practice.
3 Issue institutional completion only when requirements met.
INSTRUCTOR DEMO WATCH FOR
Conduct individual strengths and gaps debrief. Course completion is not a regulator-issued certific
FINAL FLIGHT CHALLENGE / SAFETY - SKILL - MISSION 60 / 60

Safety is non-negotiable. Skill is earned in practice. Every mis

MISSION COMPLETE.
with a useful result.
NEXT STEP
Complete the practical activity sheets, individual flight log and assessor checkride from the accom
training manual.
